Paisa Panchayat: build plan

Agentic AI Hackathon, Product Space × Wispr Flow · Problem 04 · Plan dated 31 Oct 2026, 15:05 IST · All times IST

> **Where things stand:** Yash has approved this plan, and no code exists yet. The demo video is due **tonight at 23:59**. New features stop at **17:59**, and anything unbuilt then is cut. The rest of the evening goes to testing, then the video.
>
> **Still open:** so far this has been planned as a solo build by Yash with Claude Code, so no work is assigned to a teammate yet. The sections most useful for agreeing a split are "What ships tonight" and "Timeline".

What we're building

A money ledger you feed by talking. When a big expense threatens your savings goals, the goals argue like a panchayat over how to absorb it, and you make the final call by voice.

The brief says most budgeting apps categorize transactions and stop there, without understanding goals or adapting as life changes. Paisa Panchayat treats goals as competing for the same money. Code finds three workable plans, each affected goal argues its side using your own stated reasons, and your ruling changes the plan and is remembered next time.

- **Khata (the ledger):** spending, income, cash, money lent or borrowed, and EMIs, dictated or imported. A ₹10,000 cash withdrawal counts as moving money, so it's only counted as spending once, when the cash is paid out.
- **Panchayat:** a heavy expense or a what-if convenes the goals. Nothing changes until you rule.
- **Munshi (the record-keeper):** answers questions about your file, such as how far along your iPhone goal is against today's price.

How we're scored (out of 100)

Wispr Flow usage	Prototype and UX	AI integration	Problem understanding	LinkedIn	Innovation
20	20	20	15	15	10

LinkedIn engagement also adds a +6 to +10 bonus. **The form asks only for a video**, so that's the whole submission. A Demo Day with judges follows, date to be announced, so the app stays runnable. Wispr Flow's score is about using voice to build, and that footage can't be recreated later.

Rules we're working within

- **No speech code in the app.** Wispr Flow types into a plain text box. The event requires natural speech through Flow to be the product's main input, and this meets that.
- **All numbers come from code,** never from the AI model. The AI turns speech into structured entries and writes the wording.
- **Synthetic data only,** labelled as such. We're on Gemini's free tier, whose inputs may be used by Google and read by reviewers.
- **No "CA" or "Chartered Accountant" title,** because it's a protected designation in India. No tax features.
- **It never names securities.** It educates and models scenarios, as the brief requires.
- **No live SMS or email fetching, and no hosted deployment.** Data is pasted or uploaded, and the app runs locally for the recording.

The demo video (about 2:30)

Everything built has to serve one of these beats. Figures are illustrative until a test pins them, and the script will use the tested numbers.

Time	On screen	What it proves
0:00	With Flow visible: "Laptop died, new one is 70 thousand, need it this month." A notice convenes the panchayat.	Speech becomes structured entries
★ 0:15	**The moment people remember.** Three plans in a table, labelled "What-if: nothing saved yet". Up to three goals speak, quoting your reasons. You rule: "Goa moves to June, and if the bonus is under 50 thousand, July." The dates animate.	Goals with dates, what-if, agents arguing over real plans
0:45	"ATM se 10 hazaar nikale, 5 hazaar plumber ko, Rohit ko 2000 udhar diye, EMI bhi kat gayi 8400." Rows appear with the quoted phrases. The cash counts once, and Rohit owes ₹2,000.	Hinglish, cash, lending, EMIs
1:05	Ask Munshi about the iPhone goal: saved 50% of ₹82,900 is 41.5% of ₹99,900, with the Apple link and time checked.	Your file plus a real price
1:20	Paste SMS, upload CSV and PDF. "Rahul ko jo jaata hai woh rent hai" creates a visible rule. "Import next month (simulated)" applies it unasked, fires a subscription alert and a nudge, and a ₹42,000 bonus triggers your ruling's condition, moving Goa to July.	Messy ingestion, learned corrections, recurring alerts, nudges
1:50	A jump cut through an app restart, with everything still there. The monthly review. Asking "which fund should I buy?" mid-ramble gets a refusal and a modelled scenario. An earlier ruling is cited as precedent.	Persistence, review, guardrails
2:05	25 seconds of building by voice, including a bug fixed by voice. Labels: synthetic data, simulated month.	Wispr Flow score, honesty

If the form has no limit, we also cut a 90-second version: the first two beats, the restart and the build footage.

What ships tonight

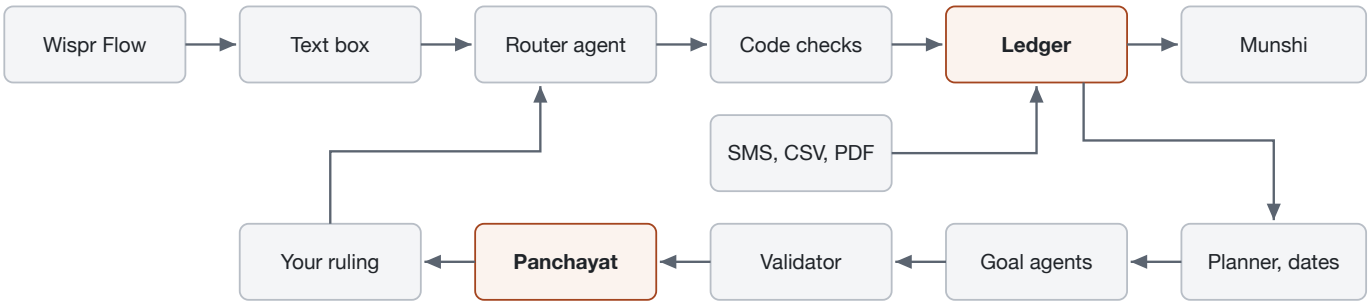

ID	Must have
M1	**Ledger:** cash wallet, withdrawals as transfers with a user override, lent and borrowed per person, card bills, EMI as a fixed monthly obligation, undo
M2	**Dictation to entries** in Hinglish, with quoted phrases, code checks and a confirm step before anything is saved
M3	**Profile and goals:** income, fixed costs, emergency fund, goals with dates, a date calculator, labelled what-if, synthetic seed data
M4	**Panchayat:** heavy-expense trigger, three code-found plans, separate goal agents, spoken ruling with conditions, remembered rulings
M5	**Ingestion:** SMS paste, CSV, one synthetic PDF layout, categorization, spoken corrections that become visible rules
M6	**Import next month:** recurring detection, price-change and possibly-unused alerts, nudges, monthly review
M7	**Guardrails:** a fixed list of allowed actions, code-filled numbers, blocked terms, 10 attack prompts tested
M8	**Munshi:** goal progress, person balance, month spend, and the Apple India list price
M9	**Submission:** build footage, video, LinkedIn posts

Extras, in order, only if time remains. Yash chose full scope, but the must-haves are expected to finish around 17:45, so most of these will probably be cut: free-form Munshi questions · web-search prices for other goals · EMI interest split · matching spoken entries to imports · a second debate round · monthly-budget agents · split bills, refunds and write-offs.

Timeline

By	Milestone	Done when
15:20	Setup (Yash)	OBS recording and capturing the Flow indicator, API key off camera, laptop plugged in, form limits checked, first LinkedIn post out, 20 Hinglish phrases dictated and saved as test data
15:20	Setup (Claude)	Repo created, database and PDF checked under Next.js, Gemini tested, shared data formats committed so parts can be built in parallel
16:30	Thin slice	Dictate, confirm, panchayat, ruling, dates move, and it survives a restart
16:30, 17:05	Pivot gates	If the slice fails at 16:30, the goal voices are dropped and the plans table stays. If that still fails at 17:05, we fall back to a simpler coach that reuses the same ledger and calculator
About 17:00	LinkedIn post 2	Short clip of Flow in action, read by 2 people first
17:45	All must-haves	Every required feature works on seed data, and every demo number is tested
17:59	**Feature freeze**	Unbuilt extras are cut
18:00–19:59	Harden	Testing, fixes, a blind judge score, polish. Subtitle tooling proven by 18:00
19:59–22:30	Video	First complete take by 20:30, then final takes, edit, subtitles
22:30	**Submit**	Target, leaving margin before the 23:59 deadline
1 Nov, 23:59	LinkedIn	Third post, then all links and engagement screenshots submitted

How it works

Nothing dictated is saved until you confirm it, and each row shows the phrase it came from. Code checks catch many mistakes, but a plausible wrong amount can only be caught by the person reading the confirm card.

Tech: Next.js 16 and React 19 with Tailwind, SQLite built into Node 26, Gemini through `@google/genai` with zod validation, pdfjs-dist for PDFs, vitest for tests. OBS and iMovie for the video, plus ffmpeg for subtitles. The main model is `gemini-3.8-flash`, falling back to `gemini-2.5-flash` and `-lite`. Free-tier limits are unpublished, so builds use a fake AI mode to save real calls for the recording.

What's real and what isn't: numbers, plans, rules and alerts are real, calculated in code. Goal voices and prose are real Gemini calls, and a fallback line is labelled if one is shown. The Apple price is a real fetch, labelled "list price" with its source. Bank data is synthetic and next month is simulated, and both are labelled on screen.

Biggest risks

Risk	What we're doing about it	If it happens
Full scope doesn't fit the time	Must-haves first, parallel builders, hard cut at the freeze	Extras get cut; the pivot gates apply
Build footage is missing	OBS on before the next prompt	Can't be recreated, so it comes first
Hinglish amounts come through garbled (untested)	20-phrase test before building	Under 18 of 20: always confirm. Under 15: use English with numbers and drop the Hinglish claim
The debate looks like theatre	Code finds the plans, goals quote your reasons, rulings are remembered, the table stays the authority	Drop the voices, or say "one model, separate voices" if that's what it is
The ledger miscounts on video	11 test cases written before features	Fixed lines for EMIs and card bills
Free-tier quota runs out before recording	Fake AI mode during builds, a call log, fallback models	Reuse labelled cached replies, and keep real calls for the main take. Yash can upgrade the key
Investment advice slips through	Fixed action list, blocked terms, attack prompts on every output	Template lines only, no AI wording
The word "panchayat" evokes khap or patriarchy	Neutral demo, no elder personas or dialect comedy, 2 readers before clip posts	Reword the post
Other teams land on the same idea	Compete on substance and execution	No uniqueness claims. Voice and lending ledgers already exist
The video gets rushed	Freeze holds, first complete take by 20:30	Shortest working path with jump cuts

Terms

Khata: a ledger. **Munshi:** a record-keeper. **Sabha:** a meeting, used here for the monthly review. **Udhar:** money lent or borrowed. **Thin slice:** the main demo path working end to end, however rough. **Feature freeze:** only fixes after this point. **Pivot gate:** a set time when a failing test triggers a planned cut. **Agent:** a separate AI call with its own instructions and facts.
